PROFESSIONAL SUMMARY

Results-driven MCA student with a solid computer science foundation, combining programming proficiency with hands-on academic and HomeLab experience in security engineering. Capable of analyzing threat intelligence and optimizing detection logic, with specialized project exposure to cloud-native environments, Kubernetes security, and machine learning-driven anomaly detection. Proficient in Linux server administration, network protocols (TCP/IP, DNS), and automation using Python. Eager to leverage practical infrastructure hardening and proactive incident response skills to contribute to enterprise-grade data centers and managed SOC workflows.

TECHNICAL SKILLS

- **Security Domains:** Security Automation, Threat Detection, Log Analysis, Vulnerability Assessment, Identity & Access Management (IAM), OWASP Top 10, Incident Response Fundamentals.
- **Infrastructure & Cloud:** Linux (Administration & Hardening), Windows, Docker, Kubernetes Fundamentals, TCP/IP, DNS, HTTP/HTTPS.
- **Programming & Scripting:** Python, Java, C++, Bash.
- **Tools & Databases:** Git, GitHub, REST APIs, Postman, CI/CD Concepts, PostgreSQL.

PROJECTS

Cognitive Overlay Digital Immune System (DIS) for Kubernetes Security

Python, Kubernetes, Docker, Machine Learning (Scikit-Learn), Linux

- Co-authored and engineered a non-intrusive behavioral security overlay designed to continuously protect ephemeral, cloud-native workloads without modifying application logic.
- Deployed distributed telemetry collection agents as a Kubernetes DaemonSet to capture node-level system metrics (CPU, memory, disk I/O, and network throughput) acting as digital antigens.
- Implemented an unsupervised detection layer executing a weighted ensemble of Isolation Forest and Autoencoder models to identify anomalous behaviors across a 100,000-sample production-anchored dataset.
- Architected an autonomous response layer utilizing Kubernetes-native primitives to execute precise real-time remediation actions (pod isolation via labeling, container restarts) with a mean inference latency below 30 ms.

Multi-OS Security Testing HomeLab

Technologies: Linux (Ubuntu Server, Kali Linux), Windows, VMware Workstation, Networking Fundamentals

- Configured a multi-node virtualized testing infrastructure utilizing a secure virtual workstation host to isolate Ubuntu Server, Kali Linux, and Windows endpoints.
- Practiced hands-on offensive security methodologies by simulating vulnerability scanning, system exploitation, and credential attacks from an adversarial Kali Linux node.
- Analyzed packet communication across segmented local virtual networks to reinforce operational understanding of core transport protocols (TCP/IP, DNS, HTTP/HTTPS) and SSH routing configurations.
- Performed system administration, firewall rule optimization, and endpoint log review to contrast attacking dynamics with reactive defensive capabilities.

EDUCATION

Master of Computer Applications

MET Bhujbal Institute of Engineering (SPPU), Nashik

SGPA: 8.82/10

Aug 2025–Present

Bachelor of Science in Computer Science

Savitribai Phule Pune University

CGPA: 7.93/10

Jun 2022–Jul 2025
